DRYFLUID **EXTREME**

BALSAM FOR MODEL RAILWAYS

DryFluid Extreme was specially developed for model railways with the aim to preserve as long as possible or rather to extend significantly the efficiency and lifetime of these miniatures. The effect of this new lubricant for axles, bearings and guides begins where others show their limits. Lowest sliding friction, maximum speed and minimal dust and dirt binding were the main objectives of the development. Newest findings in the aviation and vehicle industries are the driving forces behind this new lubricant.

SLIDE-LUBRICANT INSTEAD OF OIL

DryFLuid is a dry slide-lubricant rather than a classic grease. DryFluid is not wax, it is neither greasy nor oily but is silicone-free. A long-lasting lubrication effect is achieved using dry particles, sliding polymers and high end sliding fluids. The application and long-term effects of DryFluid Extreme will interest every model railway owner.

See for yourself the amazing effect of using DryFluid Extreme.

High End slide-lubricant for joints, axles and bearings of model and railways. It contains top-class lubricating components from the aviation and vehicle industry. Extremely low friction coefficient. Excellent long-term lubrication results.

Shake well before use!

PRODUCT-FEATURES

- Reduction of power loss on axles and bearings
- Lowest sliding friction for free movement and wear reduction
- Multistage lubricant system with immediate and long-term effects
- Dust and dirt repellent
- Extremely good creeping abilities
- Excellent material compatibility with all current metal, plastic and natural rubber materials
- Outstanding adhesive and anti-corrosive properties
